Sort Füt

The Sort Füt is a mechanically tuned resonance control device. It is purpose-built to enhance the performance of your hi-fi system and improve upon the standard spikes and stabilizers that are provided with loudspeakers and racks.

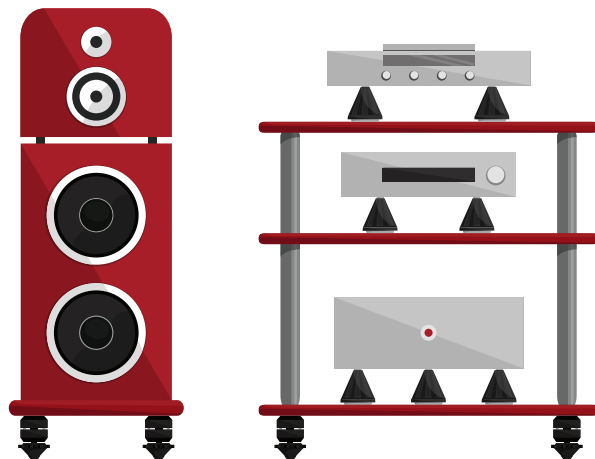

Energy is an unavoidable byproduct whenever components are in use, creating vibrations which can greatly affect the sound produced. The Sort Füt's proprietary four-part construction eliminates these unwanted vibrations by providing a direct ground path, allowing extraneous energy to escape from electronics. The result: a reduction in intermodulation distortion, a proliferation of musical information, and an increase of tonal and textural details that will allow your system to achieve the dynamic range it is capable of.

While individual units of the Sort Füt are available for purchase, the Premium Package includes all of the tools and instrument instructions necessary to get any system sorted with ease and, more importantly, precision.

The Ultimate Resonance Control Support System

The Premium Package Includes

- 4 Sort Füt units
 - Aluminum and Bronze hybrid construction
 - Finial Dome to minimize effects of vibration
 - 3 Ceramic balls (ZrO₂) to minimize contact surface area while providing physical stability to components
- Adjustment tool to customize your Sort system to your components
- Laser leveling system for precise installation
- 8mm and 6mm threaded adaptors

Sort Kone

The Sort Kone is a sophisticated, directly coupled and mechanically tuned resonance control device, using a sophisticated new approach to the problem of supporting sensitive electronics.

Whereas most equipment supports are referred to as Isolation Devices, this actually completely misunderstands the nature of the problem. The most harmful mechanical energy doesn't enter the equipment from outside, it's generated internally by the audio circuits and their power supplies. Transformers, power supply caps, even the active devices themselves, all vibrate as they operate – and those vibrations occur right where the fragile signal is, creating timing errors that smear and distort the music. The Sort Kone is designed specifically to deal with this threat to audio fidelity.

In bypassing the soft feet fitted to equipment, the Sort Kone provides a direct mechanical ground path for harmful internal energy. Without these disruptive vibrations your system will sound more natural and lifelike, your music more lively and engaging and most importantly, you will be left exceedingly satisfied with the performance achieved by your sound system. The Sort Kone can be used in triplets, quartets, or even in larger quantities depending on the needs of your components and racks.

Comprehensive, illustrated user guide available as PDF download with detailed application notes and diagrams.

The sort Kone's three-part construction employs a range of superior materials, each one improving upon the next:

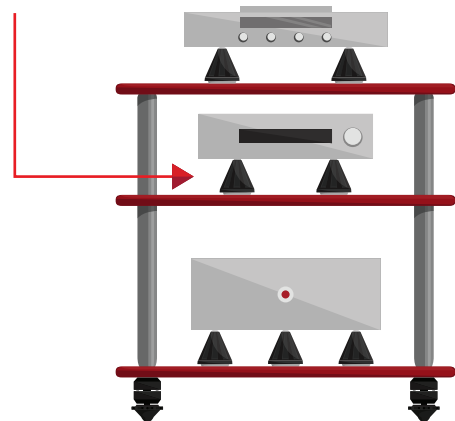

AS – aluminium post and base combined with a hardened steel coupling ball.

AC – aluminium post and base in combination with an upgraded ceramic ball.

BC – bronze post and base elements combined with a ceramic coupling ball.

TC – titanium post and base in combination with the ceramic coupling ball for ultimate performance.
